Summary Document

Meeting Specifications:

My website: PicturesquePhotos consisted of 4 total pages: home, services, faqs and appointments. Each of these pages meet the requirements of the project:

- Index.html: The homepage consists of the plugin: lightslider as well as the navigation tab as well as the ajax request to project.json file. It also contains a form which validates the email. Unless you put in the valid email address the form will not submit and direct you to the correct confirmation page. This page also contains the time and date eastern time
- Services.html: This page consists of an accordion which showcases some photos of the photographers. It also consists of a button that takes you to another page that displays the different payment plans. Once again this page contains the ajax request to the project.json file. It also contains the navigation bar.
- Faqs.html: This page contains a form for you to enter a question through a form and once again here the email is validated as well. Unless you enter a valid email address it will not go to a confirmation page. Here we have the consistent navigation bar as well and the external ajax request.
- Appointments.html: This page contains a form to allow the user to book an appointment with the photographer and has a datepicker for the user to select the date. We also made the ajax request to the project.json file as well as the consistent navigation bar. We also have email validation here. The appointments page also uses a web api to calculate location(coordinates)

Throughout the website we have a separation of code present. The html, css, js and json files are all separated. We also follow the accessibility factor required by using alt tab as well as big clear text and a proper color ratio. The website implements all the respective features necessary for the different milestones. I have also implemented the js plugin: light slider. I have also used ajax functionality with an external website which will be the index page and another one that links to a json file which contains the footer information as well as the index.html (homepage) containing the time and date according to eastern time at the top of the site. In the appointments tab we are also using the location web api.

Feedback:

I attended office hours with the professor and implemented the lightlsider according to his specifications and got my footer fixed as well as email validation. The website implements a pleasing and professional aesthetic according to the feedback.

Assessment:

This website is dedicated as a basic outline and blueprint for my friend's photography business. It has all the main components that she is looking forward to which are primarily easy ways for the user to come in contact with the business. Through the use of several forms and contact information being spread around the website that is possible. Another must have factor in a photography website is photos. I have the accordion and slider to showcase the photos of the business which will draw users in. The company logo is also displayed in each page which is important for the users to remember and have in mind. As we develop the website further we hope to add some more ways for the user to interact like a dialog box. Or include more efficient and easy ways for the pictures to be displayed. Making the website look aesthetically and professional is very important and I will work on that aspect even further.
